

Octave Matrices

Zeros \rightarrow Zeros Array

Ones \rightarrow Ones Array

Eye \rightarrow Identity Matrix

Repmat \rightarrow Replicate and tile array

rand \rightarrow Uniformly distributed random numbers

randn \rightarrow Normally distributed random numbers

\rightarrow The function rand produces a matrix of numbers from the uniform distribution over the interval

$[0,1]$. For this distribution the proportion of numbers in an interval $[a,b]$ with

$0 < a < b < 1$ is $b-a$.

Note: If numbers are specified with a

plus or minus sign take care not to leave a space after the sign, else MATLAB will interpret the sign as an addition or subtraction operator. Ex:

`>> v = [-1 2 -3 4]`

`v =`
-1 2 -3 4

Correct ✓

`>> v = [-1, 2 - 3 4]`

`v =`

-1 -1 4

Not correct ✓

\rightarrow Matlab will subtract

those numbers

`>> v = [-1, 2, -3, 4]`

`v =`

-1 2 -3 4

Also correct ✓

'Cuz we used comma(,)

• Matrices can be constructed in block form with B defined by $B = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$, we may create

$$\gg C = [B, \text{zeros}(2), \text{ones}(2), \text{eye}(2)]$$

$$C = \begin{bmatrix} 1 & 2 & 0 & 0 \\ 3 & 4 & 0 & 0 \\ 1 & 1 & 1 & 0 \\ 1 & 1 & 0 & 1 \end{bmatrix}$$

• Block diagonal matrices can be defined using the function `blkdiag`, which is easier than using the square bracket notation. Ex?

$$\gg A = \text{blkdiag}(2 * \text{eye}(2), \text{ones}(2))$$

$$A = \begin{bmatrix} 2 & 0 & 0 & 0 \\ 0 & 2 & 0 & 0 \\ 0 & 0 & 1 & 1 \\ 0 & 0 & 1 & 1 \end{bmatrix}$$

• Useful for constructing "tiled" block matrices
Is `repmat`? `repmat(A, m, n)` creates a block m-by-n matrix in which each block is a copy of A. If m is omitted, it defaults to n. Ex:

$$\gg A = \text{repmat}(\text{eye}(2), 2)$$

$$A = \begin{bmatrix} 1 & 0 & 1 & 0 \\ 0 & 1 & 0 & 1 \\ 1 & 0 & 1 & 0 \\ 0 & 1 & 0 & 1 \end{bmatrix}$$

Subscripting and the colon Notation

- For integers i and j , $i:j$ denotes the row vector of integers from i to j (in steps of 1)

A non-unit step (or stride) s is specified as $i:s:j$. This notation is valid even for non-integer i, j and s . Ex:

```
>> 1:5
```

```
ans =  
1 2 3 4 5
```

```
>> 4:-1:-2
```

```
ans =  
4 3 2 1 0 -1 -2
```

```
>> 0.75:3
```

```
ans =  
0 0.7500 1.5000 2.2500 3.0000
```

- As a special case, a lone colon as the row or column specifier covers all entries in that row or column; thus $A(:, j)$ is the j th column of A and $A(i, :)$ the i th row.

- The keyword `end` used in this context denotes the last index in specified dimension like;

$A(\text{end}, :)$, $A(:, \text{end})$

```
>> A = [2, 3, 5; 7, 11, 13; 17, 19, 23]
```

```
A =  
2 3 5  
7 11 13  
17 19 23
```

```
>> A(end, 1:end)
```

```
ans =  
13  
5
```

```
>> A([1 3], [2 3])
```

```
2 5  
19 23
```

```

>> A = zeros(3);
A(i) = primes(10);

```

```

A =
     2     3     5
     7    11    13
    17    19    23

```

```

>> A = ones(3);
A(2:3, 2:3) = 0

```

```

L =
     1     1     1
     1     0     0
     1     0     0

```

• linspace(a,b,n) generates n equally spaced points between a and b. If n is omitted it defaults to 100.

```

>> linspace(-1,1,9)
ans =

```

```

-1 -0.75 -0.5 -0.25 0 0.25 0.5 0.75 1

```

• The notation [] denotes an empty, 0-by-0 matrix.

Assigning [] to a row or column is one way to delete that row or column from a matrix.

```

>> A(2,:) = []

```

```

A =
     2     3     5
    17    19    23

```

Matrix and Array operation

$a/b \rightarrow \frac{a}{b}$ ✓
 $a \setminus b \rightarrow \frac{b}{a}$

```

>> A = [1,2;3,4];

```

```

>> A^A, A.^A

```

```

ans = [7 10; 15 22], [1 4; 9 16]

```

```

>> x = [1,2]; y = [2,3,4]; z = [1,2;3,4];

```

```

>> x.^y

```

```

ans = 1 8 81

```

```

>> z.*x

```

```

ans = 2 4 8

```

```

>> z.^2

```

```

ans = [1 4; 9 16]

```

Anonymous functions

```
>> f = @() (sin(x));
```

```
>> f(L)
```

```
ans = 0.8415
```

Sub functions

• A function M-file may contain other functions, called sub functions, which appear in any order after the main (or primary) function.

Nargin: number of input arguments. * EXAM

Ex

```
a(1,2), nargin=2
```

```
a(1,2,3), nargin=3
```

Nargout: Number of output arguments

Varargin: Variable argument list

Varargout: Variable output argument list

strcat

```
>> strcat('Hello', ' world')
```

```
ans = Hello world
```

```
>> strcat('Hello ', 'world')
```

```
ans = Hello world
```

strcmp

```
>> strcmp('Mehaba', 'mehaba')
```

```
ans = 0
```

```
>> strcmpi('Mehaba', 'mehaba')
```

```
ans = 1
```

```
Ex 'Mehab6' == 'Mehab7'
```

```
ans = 1 1 1 1 1 1 0
```

findstr

```
>> findstr('abacab', 'a')
```

```
ans = 1 3 5
```

strmatch

```
>> strmatch('apple', 'apple juice')
```

```
ans = 1
```

strncmp

```
>> strncmp('abc', 'abd', 3)
```

```
ans = 1
```

Cell array where data is (Page 270)
→ `xc = {'Chemistry', 'Physics'}`

`xc =`
`{`
 `[1,1] = Chemistry`
 `[1,2] = Physics`
`}`

Graphics (page 85),

- `plot3(x, y, z)`
 - `mesh(x, y, z)`
 - `surf(x, y, z)`
 - `meshgrid(x, y)`
- no need to order between these parameters

Mid EXAM: 1-2-3-4-5-6-7-8-10-18

Matrix Manipulation

- The reshape function changes the dimensions of a matrix; `reshape(A, m, n)` produces an $m \times n$ matrix whose elements are taken columnwise from A. For example:

```
>> A = [1 4 9; 16 25 36], B = reshape(A, 3, 2)
```

```
A =  
    1    4    9  
   16   25   36
```

```
B =  
    1    25  
   16    9  
    4   36
```

<code>reshape</code>	Change size
<code>diag</code>	Diagonal matrices and diagonals of Matrix
<code>blkdiag</code>	Block diagonal matrix
<code>tril</code>	Extract lower triangular part
<code>triu</code>	Extract upper triangular part
<code>flipr</code>	Flip matrix in left/right direction
<code>flipud</code>	Flip matrix in up/down direction
<code>rot90</code>	Rotate matrix 90 degrees

- The function `diag` deals with the diagonals of a matrix and can take a vector or a matrix as argument. For a vector x , `diag(x)` is the diagonal matrix with main diagonal x .

```
>> diag([1 2 3])  
ans =  
    1    0    0  
    0    2    0  
    0    0    3
```

- More generally, `diag(x, k)` puts x on the k th diagonal

Data Analysis

```
>> X = [4, -8, -2, 2, 0]
```

```
X =  
    4   -8   -2    2    0
```

```
>> [min(X), max(X)]
```

```
ans =  
   -8    4
```

```
>> sort(X)
```

```
ans =  
   -8   -2    0    2    4
```

Chapter 9 - Linear Algebra

9.1. Norms and condition numbers

Ex

$$A = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix}$$

$$A = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix}$$

$$\begin{bmatrix} 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix}$$

$$\begin{bmatrix} 7 & 8 & 9 \end{bmatrix}$$

$$\gg [\text{norm}(A, 1), \text{norm}(A, 2), \text{norm}(A, \infty), \text{norm}(A, 'fro')]$$

Ans:

$$18.0000 \quad 16.8481 \quad 24.0000 \quad 16.8829$$

$\text{norm}(A, 1)$ = Sum of the greatest column of the our matrix

$\text{norm}(A, \infty)$ = Sum of the greatest row of the our matrix

$\text{norm}(A, 'fro')$ = Sum of the all indices and taking their squares
after taking their sqrt this will be our result.

Basic Matrices

$$A \cdot x = b \text{ result of } x = A \backslash b$$

$$\gg 2 \cdot x_1 + 3 \cdot x_2 = 4;$$

$$\gg 3 \cdot x_1 + 5 \cdot x_2 = 5;$$

$$A = \begin{bmatrix} 2 & 3 \\ 3 & 5 \end{bmatrix} \quad x = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} \quad b = \begin{bmatrix} 4 \\ 5 \end{bmatrix}$$

9.2 Overdetermined System (Asim tamam sistemler)

- Equation count is more than variable number.
- PIV: pseudo inverse sistemler, en iyi tahmin sistemler, moore penrose yöntemi sistemler
- $\text{inv}(A)$ olarak A $n \times n$ olarak ve $\det(A) \neq 0$ olarak
- Her matrixin $\text{pinv}()$ değeri vardır.
- $Ax = b$ şeklinde bir asim tamamlı sistem için;
 $x = \text{pinv}(A) \cdot b$

Hocanın derste yaptığı

$$x^2 + 2x + 1 = 0$$

3.3 undetermined system (2)

$$A = \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix}, b = \begin{bmatrix} 3 \\ 1 \end{bmatrix}$$

$$A = \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix}$$

$$b = \begin{bmatrix} 3 \\ 1 \end{bmatrix}$$

$$b = \begin{bmatrix} 3 \\ 1 \end{bmatrix}$$

~~XXXX~~
SUNULI

$$x_1 + x_2 + x_3 = 3$$

$$x_1 + x_2 + x_3 = 1$$

Equation < Variable

$$x = A \backslash b; y = \text{pinv}(A) * b;$$

$$x = \begin{bmatrix} 2 \\ 0 \\ 1 \end{bmatrix}$$

$$y = \begin{bmatrix} 2 \\ 0 \\ 1 \end{bmatrix}$$

$$y = \begin{bmatrix} 2 \\ 0 \\ 1 \end{bmatrix}$$

$$y = \begin{bmatrix} 2 \\ 0 \\ 1 \end{bmatrix}$$

Equation count is less than variable count

$$x = \text{pinv}(A) * b$$

$$x = \begin{bmatrix} 2 \\ 0 \\ 1 \end{bmatrix}$$

$$x = \begin{bmatrix} 2 \\ 0 \\ 1 \end{bmatrix}$$

$$x = \begin{bmatrix} 2 \\ 0 \\ 1 \end{bmatrix}$$

Same results

$$x = A \backslash b$$

$$x = \begin{bmatrix} 2 \\ 0 \\ 1 \end{bmatrix}$$

$$x = \begin{bmatrix} 2 \\ 0 \\ 1 \end{bmatrix}$$

$$x = \begin{bmatrix} 2 \\ 0 \\ 1 \end{bmatrix}$$

$$x = \text{pinv}(A) * b$$

$$x = \begin{bmatrix} 2 \\ 0 \\ 1 \end{bmatrix}$$

$$x = \begin{bmatrix} 2 \\ 0 \\ 1 \end{bmatrix}$$
